

(a) Meridional orbit surface

(b) Axial revolution

(c) Global period tests

$$P_\zeta = \oint_\gamma \star_q d\varpi$$

$$P_\zeta = 0 \iff \text{global conjugate } \zeta$$

$$P_\chi = \oint_\gamma \omega_k$$

$$P_\chi = 0 \iff \text{global twist } \chi$$

$$P_\mu = \oint_\gamma \alpha_\mu$$

$$P_\mu = 0 \iff \text{single-valued } \mu$$

Vanishing periods give exactness.
They do not guarantee a global Weyl chart:
noncriticality, injectivity, and properness remain.
